                          This invention relates to novel isolated Streptococcus pneumoniae nucleic acid molecules and the antigenic polypeptides encoded by them. The invention may be useful for the production of compounds with an antibacterial activity or for gene therapy. The nucleic acid molecules, compositions and methods disclosed are useful for treating Streptococcus pneumoniae infection. The present sequence is that of an S pneumoniae protein of the invention.
                                                                                                                                                                                                                                                                      The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

c comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with the improved plant properties, e.g. improved cold, heat or drought tolerance, to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the coll cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan condition, improved lignin production or improved galactomannan condition, improved lignin production or improved galactomannan condition. Note: The sequence data for this patent did not scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant comprising the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct is useful for improving plants with the recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with construct to plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved justed by modification of carbohydrate, nitrogen or content, improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form the form term of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.

the invention fraction to an isolated minister actual comparisons of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
concleic acid; (2) a host cell containing the vector; (3) an isolated
colypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide of its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide of its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide of its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide of producing the polypeptide; (6) inhibiting cellular
corportiseration; (7) identifying a compound that influences the activity of
the gene product or that has an activity against a biological pathway
corporated for proliferation-required gene or its gene product lies
or a gene on which the test compound that inhibits product lies
or againsm acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
product is overexpressed or underexpressed; (12) determining the extent
compound's activity; (11) a culture comprising strains in which the gene
corporates or (13) identifying the target of a compound that inhibits the
corporation of an organism. The antisense nucleic acids are useful for
corporatined for proliferation in cells other than S. aureus, S. typhimurlum,
corporated prokaryotic essential genes. Note: The sequence data for this
confidential and product of the parined specification, but was obtained
in electronic format directly from WIPO at
                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising any one of

Bacterial polypeptide #19087.

Recombinant DNA construct, transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis;

RESULT 13

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a cransformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant comprising the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress production. This sequence represents a bacterial polypeptide used in the conduction. This sequence represents a bacterial polypeptide used in the form intend specification but was obtained in electronic format from intend a pecification or harman the form intend specification or harman the printed specification or man and the form intends the sequence when the man and the sequence when the conduction when the printed specification and the printed specification or harman harman the form intends and the sequence when the sequence when the conduction in the sequence when the conduction is the printed specification or the sequence when the conduction is the printed specification or provided plant in the sequence when the conduction is the printe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24 GINTEYDNLIFVINSIKQEIVNRVQNPRDERGPNMGQKLEILIKDTLGLPVA----- 75

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A novel receptor interacting factor (AAW18226) is designated SWRT, i.e. silencing mediator (Go-repressor) for retinoic acid receptor (RAR) and thyroid hormone receptor (TR). Its association with RAR and TR both in solution and on DNA response elements is destabilised by ligand. The interaction of SMRT with mutant receptors correlates with the transcriptional silencing activities of receptors. In vivo. SMRT unctions as a potent co-repressor. A GAL4 DNA binding domain fusion of SMRT behaves as a frank repressor of a GAL4-dependent reporter. These data identify a novel class of cofactor which is believed to repersent an important mediator of hormone action. Full-length cDNA for SMRT has been isolated from a HeLa library in a two-hybrid screen using a GAL4 DNA binding domain/RXR fusion protein as bait

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Wood WI;

cancer

```
The invention relates to an isolated SWRTe nucleic acid molecule. The nucleic acids are useful in gene therapy, as hybridisation probes for identifying SWRTe-encoding nucleic acid molecules and as primers for amplifying of SWRTe nucleic acid molecules and as primers for useful as immunogens to raise anti-SWRTe antibodies. The polypeptides are useful as targets for discovering and developing modulating agents to regulate a variety of cellular processes, in screening assays, in predictive medicine, in therapeutic or prophylactic treatment, in chromosome mapping, tissue typing and in forensic identification of a biological sample. Modulators of SWRTe are useful for treating or preventing a condition associated with aberrant SWRTe protein or nucleic acid expression or activity, such as cancer. The present sequence represents the amino acid sequence of the human nuclear receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New SMRTe proteins and nucleic acids, useful in gene therapy, predictive medicine, therapeutic or prophylactic treatment, chromosome mapping, tissue typing and in forensic biology.

Sequence 3809, Application US/09583110

Patent No. 6699703

GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al.
ITILE OF INVENTION: Nucleic Acid and Amino Acid Sequences Relating to Streptococcus
TITLE OF INVENTION: Pneumoniae for Diagnostics and Therapeutics
FILE REPERENCE: PATHO0-079

CURRENT APPLICATION NUMBER: US/09/583,110

CURRENT FILING DATE: 2000-05-26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä

FUDICANT: BETSETCH-Myers Squibb Company

APPLICANT: BETSETCH-Myers Squibb Company

APPLICANT: DEATHER ADDICATION OF GENES FOR PREDICTING ACTIVITY OF COMPOUNDS THAT

TITLE OF INVENTION: INTERACT WITH AND/OR MODULATE PROTEIN TYROSINE KINASES AND/OR

TITLE OF INVENTION: PROTEIN TYROSINE KINASE PATHWAYS IN BREAST CELLS

CURRENT APPLICATION NUMBER: US 40406,385

PRIOR FILING DATE: 2002-08-26

NUMBER OF SEQ ID NOS: 571

SOFTWARE: Patentin version 3.2

SEQ ID NO 143

LEMOTH: 339

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
